About Us

Founded in 1983, MIA company is a large-scale production capability factory, focusing on environmental ventilation equipments' R&D and production. As early as the 1980s, the MIA Company located in the Minamikoshigaya of Saitama, had became the major supplier of building ventilation systems locally. In the late 1990s, MIA products had been sold worldwide with powerful research and development backgrounds. By virtue of its first-class scientific and technological strength and strong production capacity, MIA company has become a leader in the increasingly fierce competition in the field of ventilation. At that time, MIA became one of the main brands of household names in the healthy home industry.

At the beginning of this century, MIA has become the designated brand of ventilation equipment of several leading real estate enterprises in Japan. In today's Japan and European & American markets, MIA has become a synonym for high-end healthy home, according to incomplete statistics, one of every three Japanese residents is using MIA fresh air system; MIA has been quietly dedicated to human health, has become the world's most popular brand among several famous brands.

In order to achieve the strategic goal of globalization and consolidate the international famous brand position of MIA, MIA Company has established sales centers and business representative offices in more than 70 countries around the world. MIA Chinese company was established in Suzhou in recent years and operates with independent financial accounting. Suzhou MIA Intelligent Technology Co., Ltd. is located in the "most economically dynamic" Changsanjiao Shanghai-Hangzhou economic circle of science and technology: Suzhou City; Based on the China-Singapore Suzhou Industrial Park, a concentrated area of the World's top 500; In order to optimize the quality of people's life, improve the urban living environment, protect the ecological balance of the earth, continuous research and development, the introduction of a series of energy-saving, environmental protection, health of high-tech products; create warm and comfortable quality life for all customers.

MIA Story

Breathing is the first instinctive action of human beings, and the most natural thing we did everyday. It is estimated that an adult takes more than 17,000 breaths a day! So clean and fresh air is vital to our health and living environment.

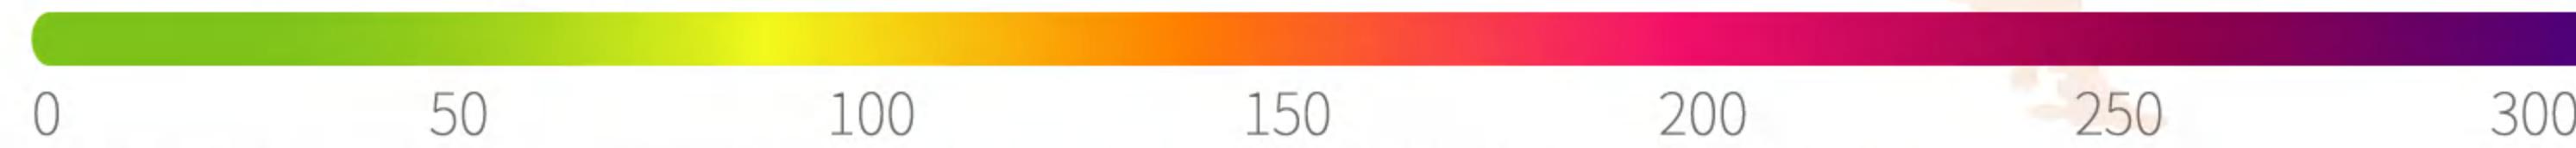

On a cold November day more than 30 years ago in Saitama, then industrial town in Japan, our founder Ishibashi Mitsu realized there was a growing problem lurking in people's home - poor indoor air.

He invented a simple ventilation device to solve the problem of bad inroom ventilation, with using mechanical ventilation to bring fresh & filtered air into the room. Our passion for supplying high quality indoor air is the same as it was many years ago until now. Our business has grown and is now one of the large-scale enterprises in the field of ventilation equipment in the world.

We have professional enthusiastic planners to improve your indoor air quality, our enthusiastic and employed professional installation team will ensure that the professional ventilation solutions are implemented to meet your home's fresh air needs.

Our philosophy is to manufacture sustainable products, to realize energy-saving and environmentally friendly. We are committed to improving the air environment all over the world, creating and sustaining employment globally. Our products are 100% fully tested before leaving the factory. We committed to creating high-quality products with maximum value for customers.

Air Ventilation System Concept

Energy and Environment

Air conditioning is a necessary household appliance for each household to avoid heat and cold, but the congenital defects of air conditioning have been troubling the users. Indoor air conditioning environment has serious air pollution, which is the root cause of the outbreak and spread of air conditioning diseases, respiratory diseases and SARS virus. Experiments show that, when air conditioning is working, indoor air bacteria content is 3-4 times of the room air conditioning not working. Indoor air pollution has become the biggest factor endangering human health environment. Air oxygen content is low in the air conditioning environment, and insufficient fresh air volume has not been completely solved. Cold & heat in the air conditioning exhaust can not be effectively recovered, which causes shocking energy waste phenomenon.

High Efficiency Energy Saving

The application of high-tech nano film technology, ultra-thin composite material technology, antistatic and maintenance-free technology and noise reduction technology makes the fresh air ventilator break through the traditional technical bottleneck of low heat recovery efficiency and high air leakage rate. The heat recovery efficiency reaches more than 90%, and the energy recovery efficiency of exhaust wind is greatly improved, so that users can enjoy more economical and affordable fresh air. The use of fresh air ventilator can improve the use efficiency of air conditioning system and increase the amount of fresh air supplement without increasing energy consumption in the annual ventilation process, improve indoor air quality and reduce energy consumption to a minimum. It can not only reduce the capacity of air conditioning host and the total one-time investment of equipment, but also reduce the overall operating cost of the system.

New Concept of Fresh Air Health

The heat insulation and high air tightness of the air conditioning environment determine that the natural ventilation of the air conditioning room with windows must be fully replaced by mechanical ventilation. According to the needs of users, fresh air ventilator can carry out whole air replacement of the air conditioning environment, to make the original closed house becoming a breathing house. All kinds of pollutants in the house, such as smoke, dust, ozone and other odors, can be removed with the regular air exhaust & supply, so that the indoor air will be clean and comfortable with sufficient oxygen. Fresh air ventilator has literally become the "heart & lung" of modern residential, is a new type of fresh air health and environmental protection products.

Product Warranty Policy

All customers in China who buy MIA fresh air system products are free to choose the 10-year quality assurance value-added after-sales service provided by MIA company. During the 10-year quality assurance period after the purchase of the devices, our company promises to respond promptly and positively in case of any non-man-made fault problems. For the problem that cannot be solved quickly, free replacement of related products of the same model. We have solved ventilation problems in homes of hundreds of thousands of people around the world. MIA company works closely with real estate developers and housing contractors in many countries around the world, and aims to create clean indoor air environment for people all over the world.

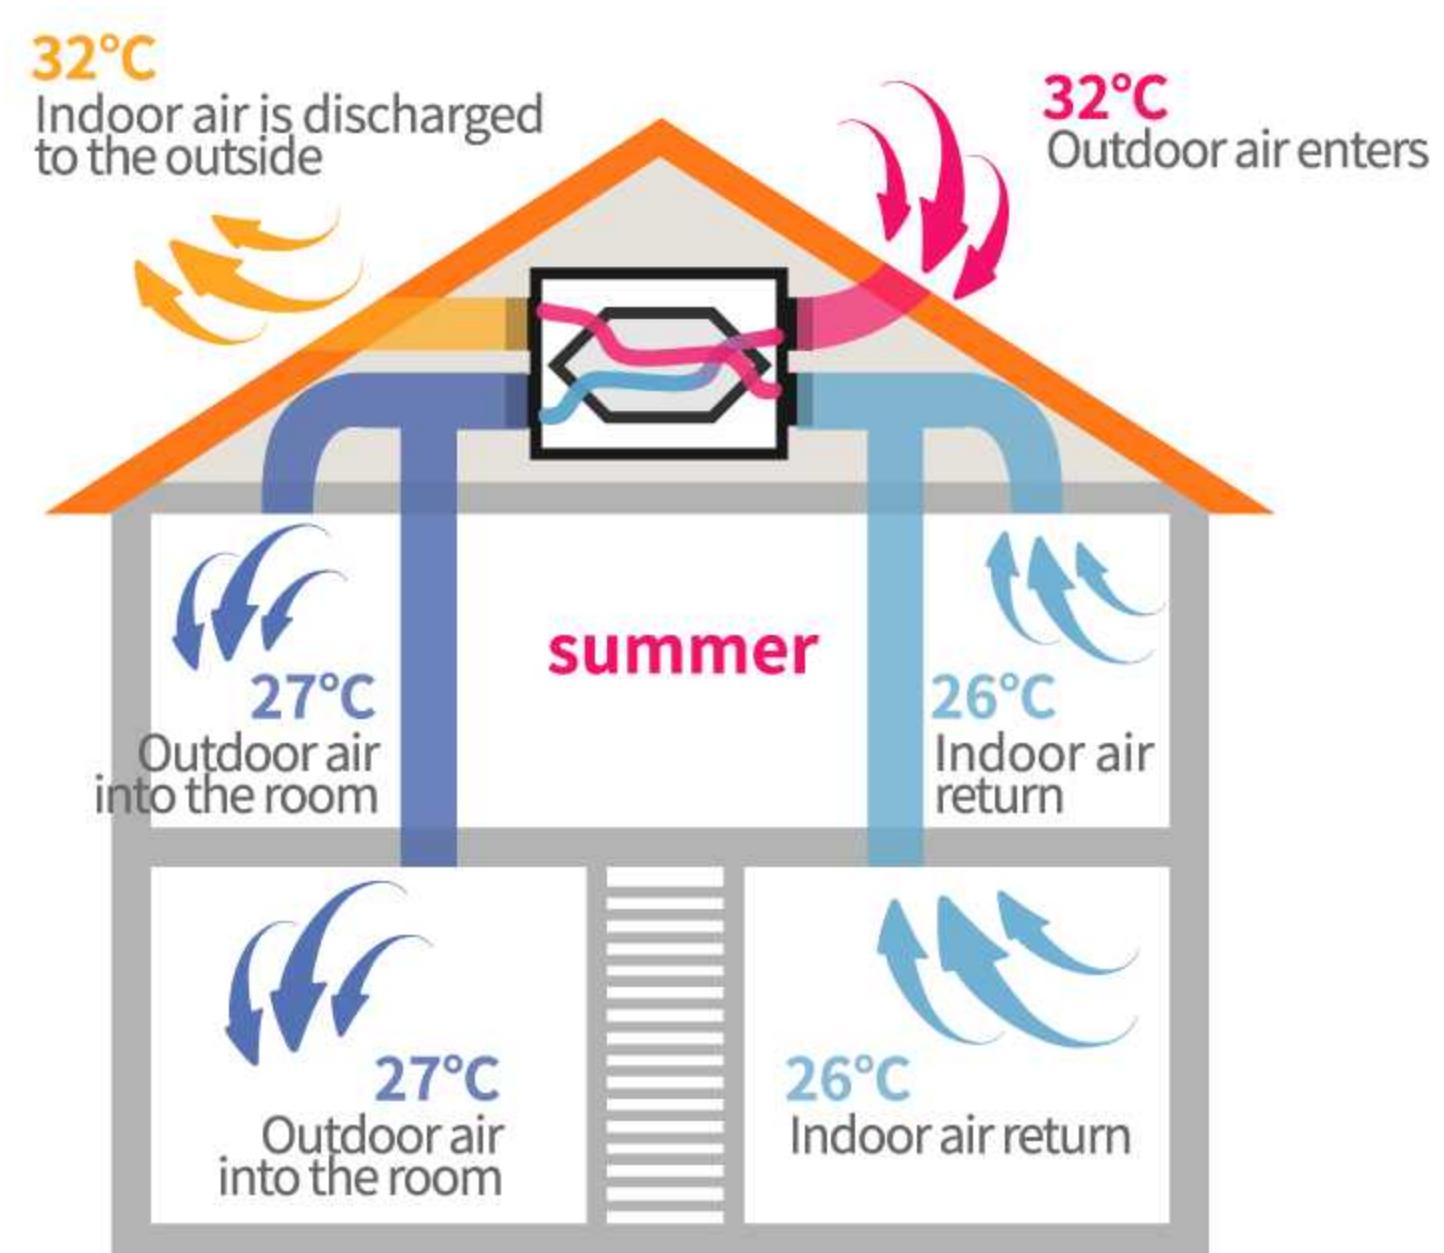

Air-Conditioner Partner

People spend more than 85% of their life indoors, so the air quality of air conditioning environment is closely related to human health. Human health = air + water + nutrition + appropriate exercise, the four are indispensable, fresh air ventilator not only solves the problem of insufficient fresh air volume, but also recovers the energy in exhaust air, in line with the concept of health and energy saving, is an indispensable companion product of air conditioner. Through professional training, our installation team has a high customer service ability. Not only an in-depth understanding of our products, but also to ensure the quality of ventilation works to meet the unique needs of your family. After company's standardized training, the installation team are equipped with the professional technology, can provide you with the highest level and the best quality of installation services.

Principle of Energy Recovery Ventilation

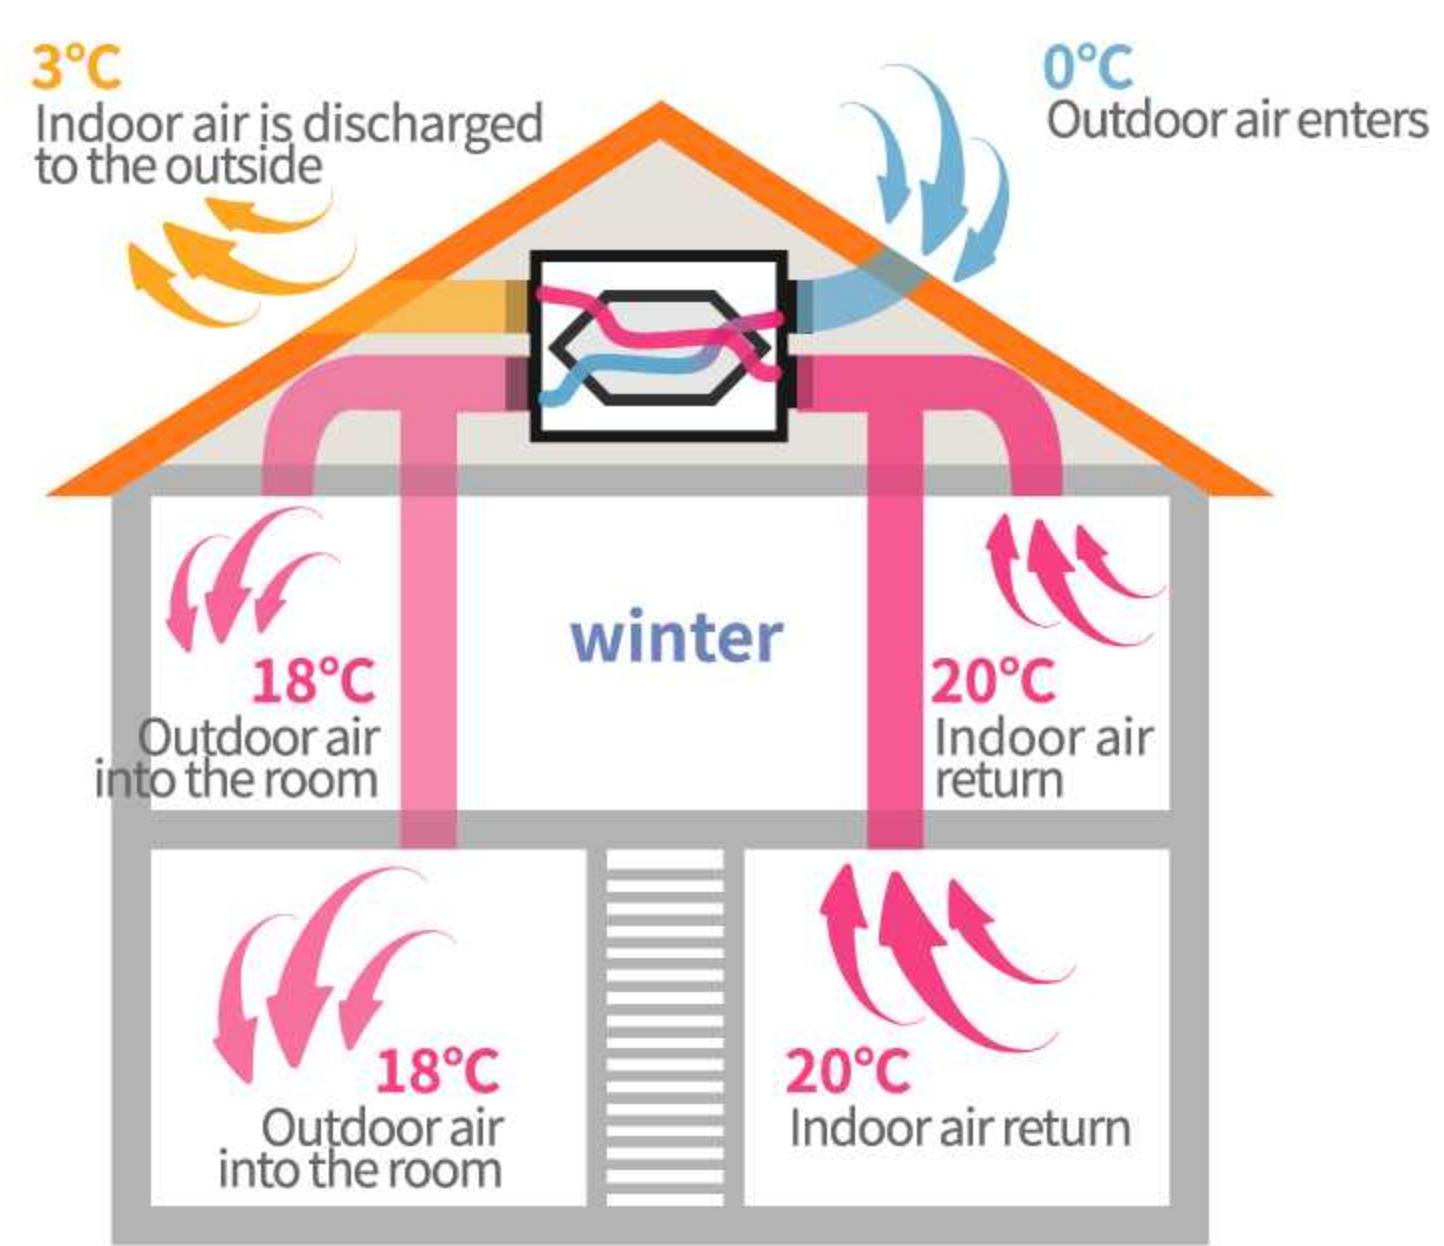

Schematic Diagram of Working Conditions in Summer: Indoor Cooling

For example: in summer, the room is cooled, when indoor 26°C air passes through the heat exchange core, the cold energy will be recovered by the heat exchange core and discharged to the outside. When outdoor 33°C air passes through the heat exchange core for cooling exchange, the temperature is about 27°C when it is sent into the room, so as to maintain the indoor temperature unchanged while ventilating, to realize energy-saving.

Schematic Diagram of Working Conditions in Winter: Indoor Heating

For example: in winter, the room is heated, when indoor 20°C air passes through the heat exchange core, the heat energy will be recovered by the heat exchange core and discharged to the outside. When outdoor 0°C air passes through the heat exchange core for heating exchange, the temperature is about 18°C when it is sent into the room, so as to maintain the indoor temperature unchanged while ventilating, to realize energy-saving.

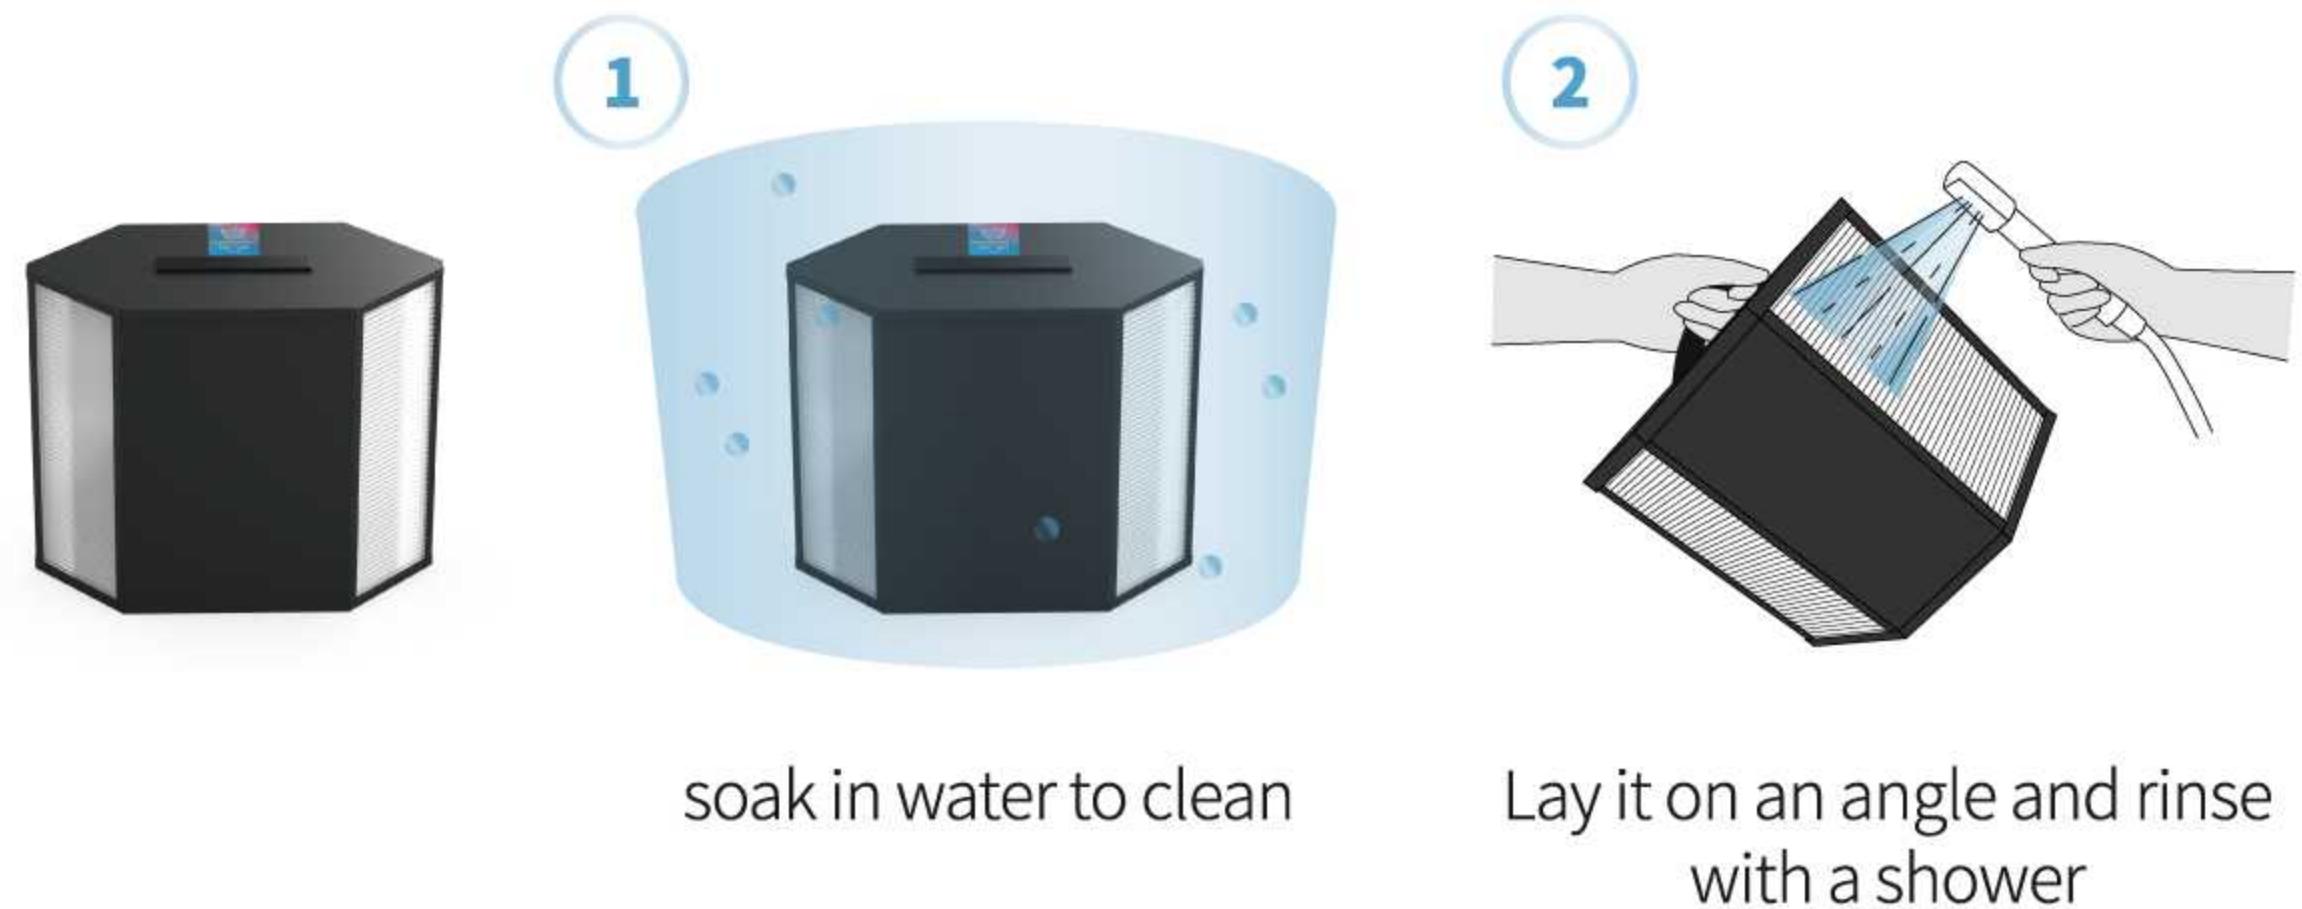

$$\text{heat exchange ratio \%} = \frac{\text{enthalpy value of fresh air}}{\text{enthalpy value of air supply}} \times 100\% = \frac{l_{OA}}{l_{SA}} \times 100\%$$

$$= \frac{\text{Enthalpy value of fresh air}}{\text{Enthalpy value of indoor air return}} \times 100\% = \frac{l_{OA}}{l_{SA}} \times 100\%$$

MIA Heat Recovery Exchanger

The PSY high thermal conductivity of molecular material has high heat recovery efficiency. It can infiltrate water molecules at the same time of exchanging heat. MIA heat recovery exchanger can be soaked in water to clean, also can be layed on an angle and rinsed with a shower directly, to avoid bacteria and molds.

Selection Guide

Select the different installation forms of air ventilation according to the characteristic of the building structure. Confirm the appropriate air volume according to the house's use, area, and containing people. Select the ventilation's specification and amounts according to the confirmed fresh air volume.

The Formula Of Calculating The Room Volume: indoor air volume= length x width x height(below the air outlet)
numbers of ventilator= room volume x required air changes rate ÷ Rated air volume per ventilator

For example: In a room, area: S=65(m²), height: h=3(m), member: n=25 (people)
Calculated by the fresh air volume everyone needs, [the air volume everyone need: q=30(m³/h)], so the total fresh air volume Q1=n×q=25×30= 750(m³/h).
If calculated by the fresh air changes rate, [the fresh air change rate P=4], so the fresh air Q2=p×s×h= 4×65×3=780(m³/h);
Due to Q2>Q1, so here we take Q2 for the reference;
Combine with the products type, here we suggest MIA-AHE80N ERV.

Needed fresh air volume of different types of building in air-conditioning environment.(Volume: m ³ /h/person)							
RoomType	Volume	RoomType	Volume	RoomType	Volume	RoomType	Volume
General Villa	30	General Office	30	Gym	60~80	Hotel	30~50

About the selection of ventilators' hoisting position, can according to the following aspects:

Whether the ceiling is strong enough; Whether the lifting space is large enough; Whether the pipeline installation is convenient; The tuyere is installed along with the beam to keep minimized wind resistance. The distance between the air supply outlet and discharge positions must be kept at more than 1.2 meters. Air detection switch should be installed in the position that can reflect the whole room's air quality.

Central ERV

Residential High Wind Pressure Model

Function: The outdoor air is pumped into the equipment for filtration, and then sent into the room after heat exchange. At the same time, the indoor air is pumped into the equipment for heat recovery and then discharged out of the room, so as to realize the purification and replacement of the whole room air while maintaining the indoor temperature and humidity.

Energy Recovery Exchanger core

The Energy Recovery Core is made of PSY high thermal conductivity molecular material, developed by Japanese doctor team. It has high heat recovery efficiency and it can infiltrate water molecules in the process of heat exchange. The exchanger core is washable, which can avoid bacteria and molds production, also can reduce consumables.

High-voltage Electrostatic Precipitator

The high-voltage electrostatic precipitator adopts the pin-type electric field discharge method to replace the traditional tungsten wire high-voltage removal method. The thickness is only 4cm, suitable for various kinds of our models, PM2.5 removal rate is highly to 98%. Also it can effectively kill bacteria to prevent the infection. It can be washed or cleaned with brush, no need to be replaced, greatly save the cost.

High Efficiency Particulate Air (HEPA-H13) Filter

The thickness of this filter is only 3cm. The plastic frame has higher sealing than paper frame, and we use the environmental friendly imported sealant, no color & odor, to ensure healthy and avoid pollution. The raw material of this HEPA filter is from 3M, European standard H13 level. PM2.5 removal rate can be up to 99.97%, and the large dust holding capacity can save the total cost of consumables.

Primary Activated Carbon Filter

The plastic frame of this filter seals better than the paper frame, and it is only 2cm thick. The filter is made of composite fiber sprayed with activated carbon powder that can filter out dust particle efficiently. The wind resistance of this filter is very low. The method of spraying makes the activated carbon powder more evenly distributed, which can maximize the effect of activated carbon. This washable filter can be used repeatedly and the combination of primary filter with activated carbon can greatly save your cost of consumables.

Fresh Air Dehumidifier

Central ERV & Dehumidifier (2 in 1 Unit)

The figure above is a schematic diagram of the structure, which is subject to the actual object.

Heat recovery ventilation mode:

Suck outdoor air into the equipment, being recovered through heat exchanger and purified by filters, and then sent into the room. At the same time, extract the inroom air into the equipment and exhaust to the outside through heat exchanger, to achieve the simultaneous replacement of inroom and outside air.

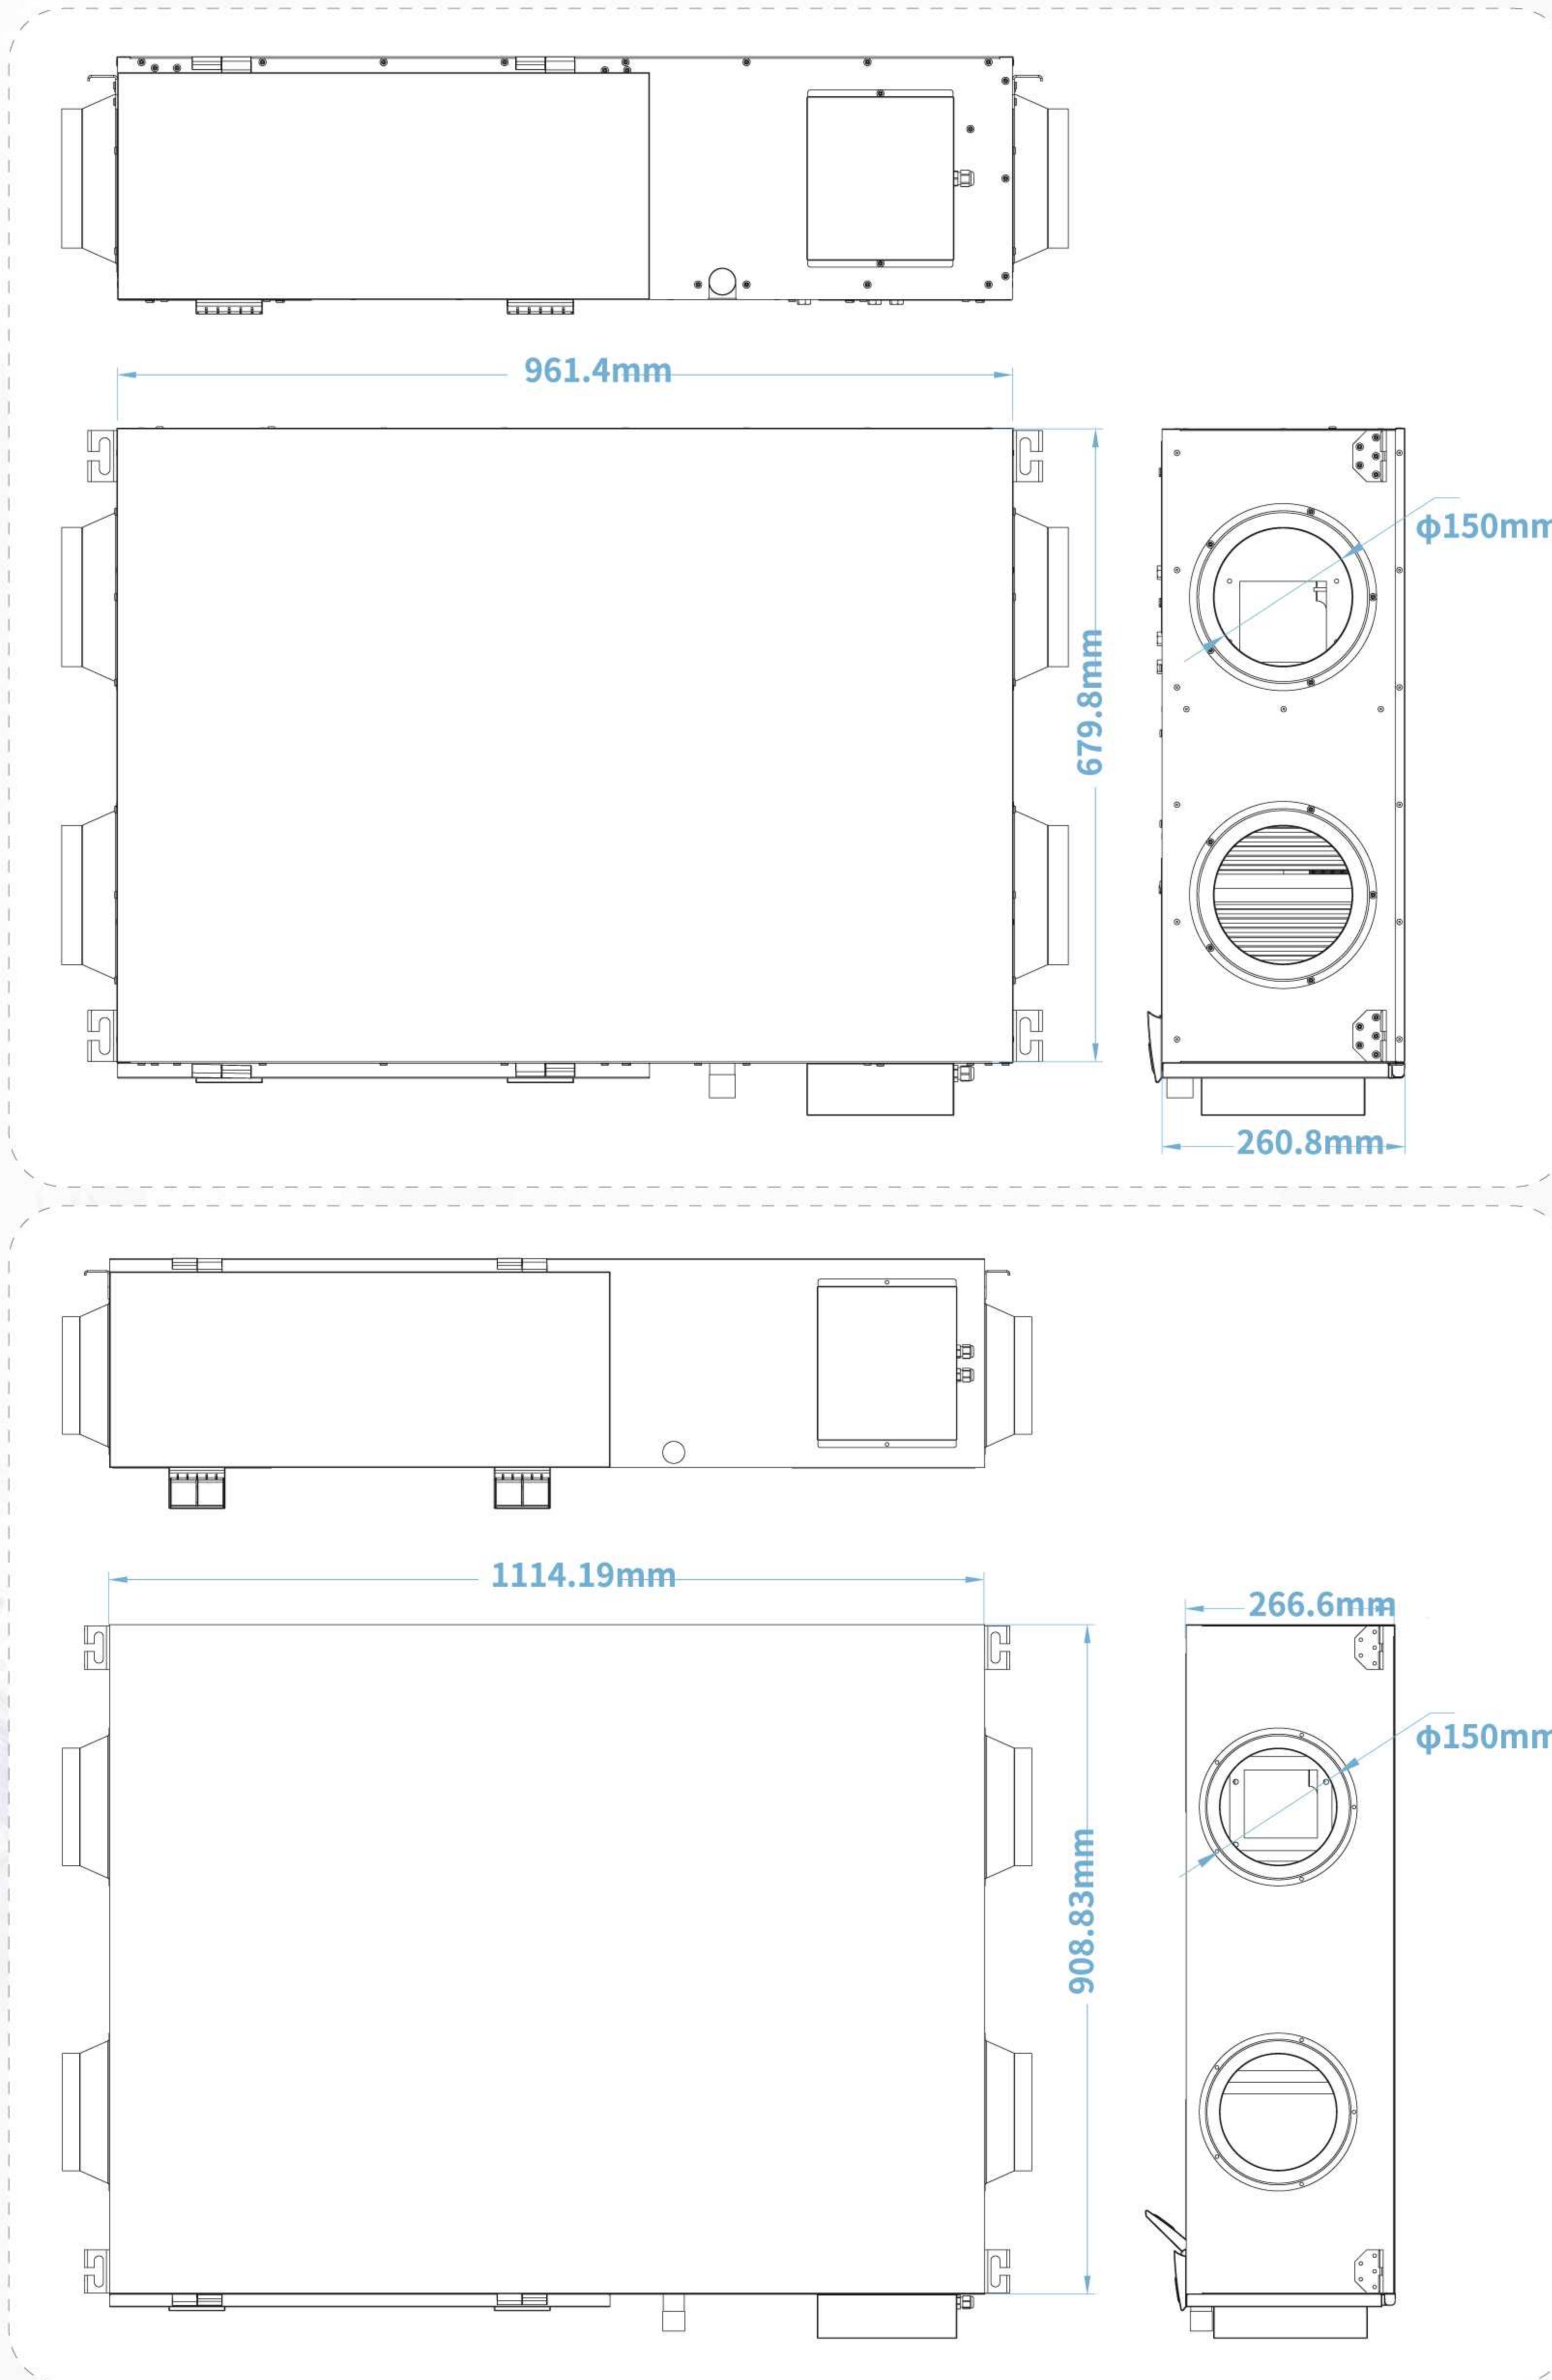

Fast dehumidification mode:

Suck the room humid air into the equipment, being dehumidified by the compressor surface cooler evaporator and purified by filters, and then sent back to the room.

Fresh Air Dehumidifier

Central Fresh Air Dehumidifier

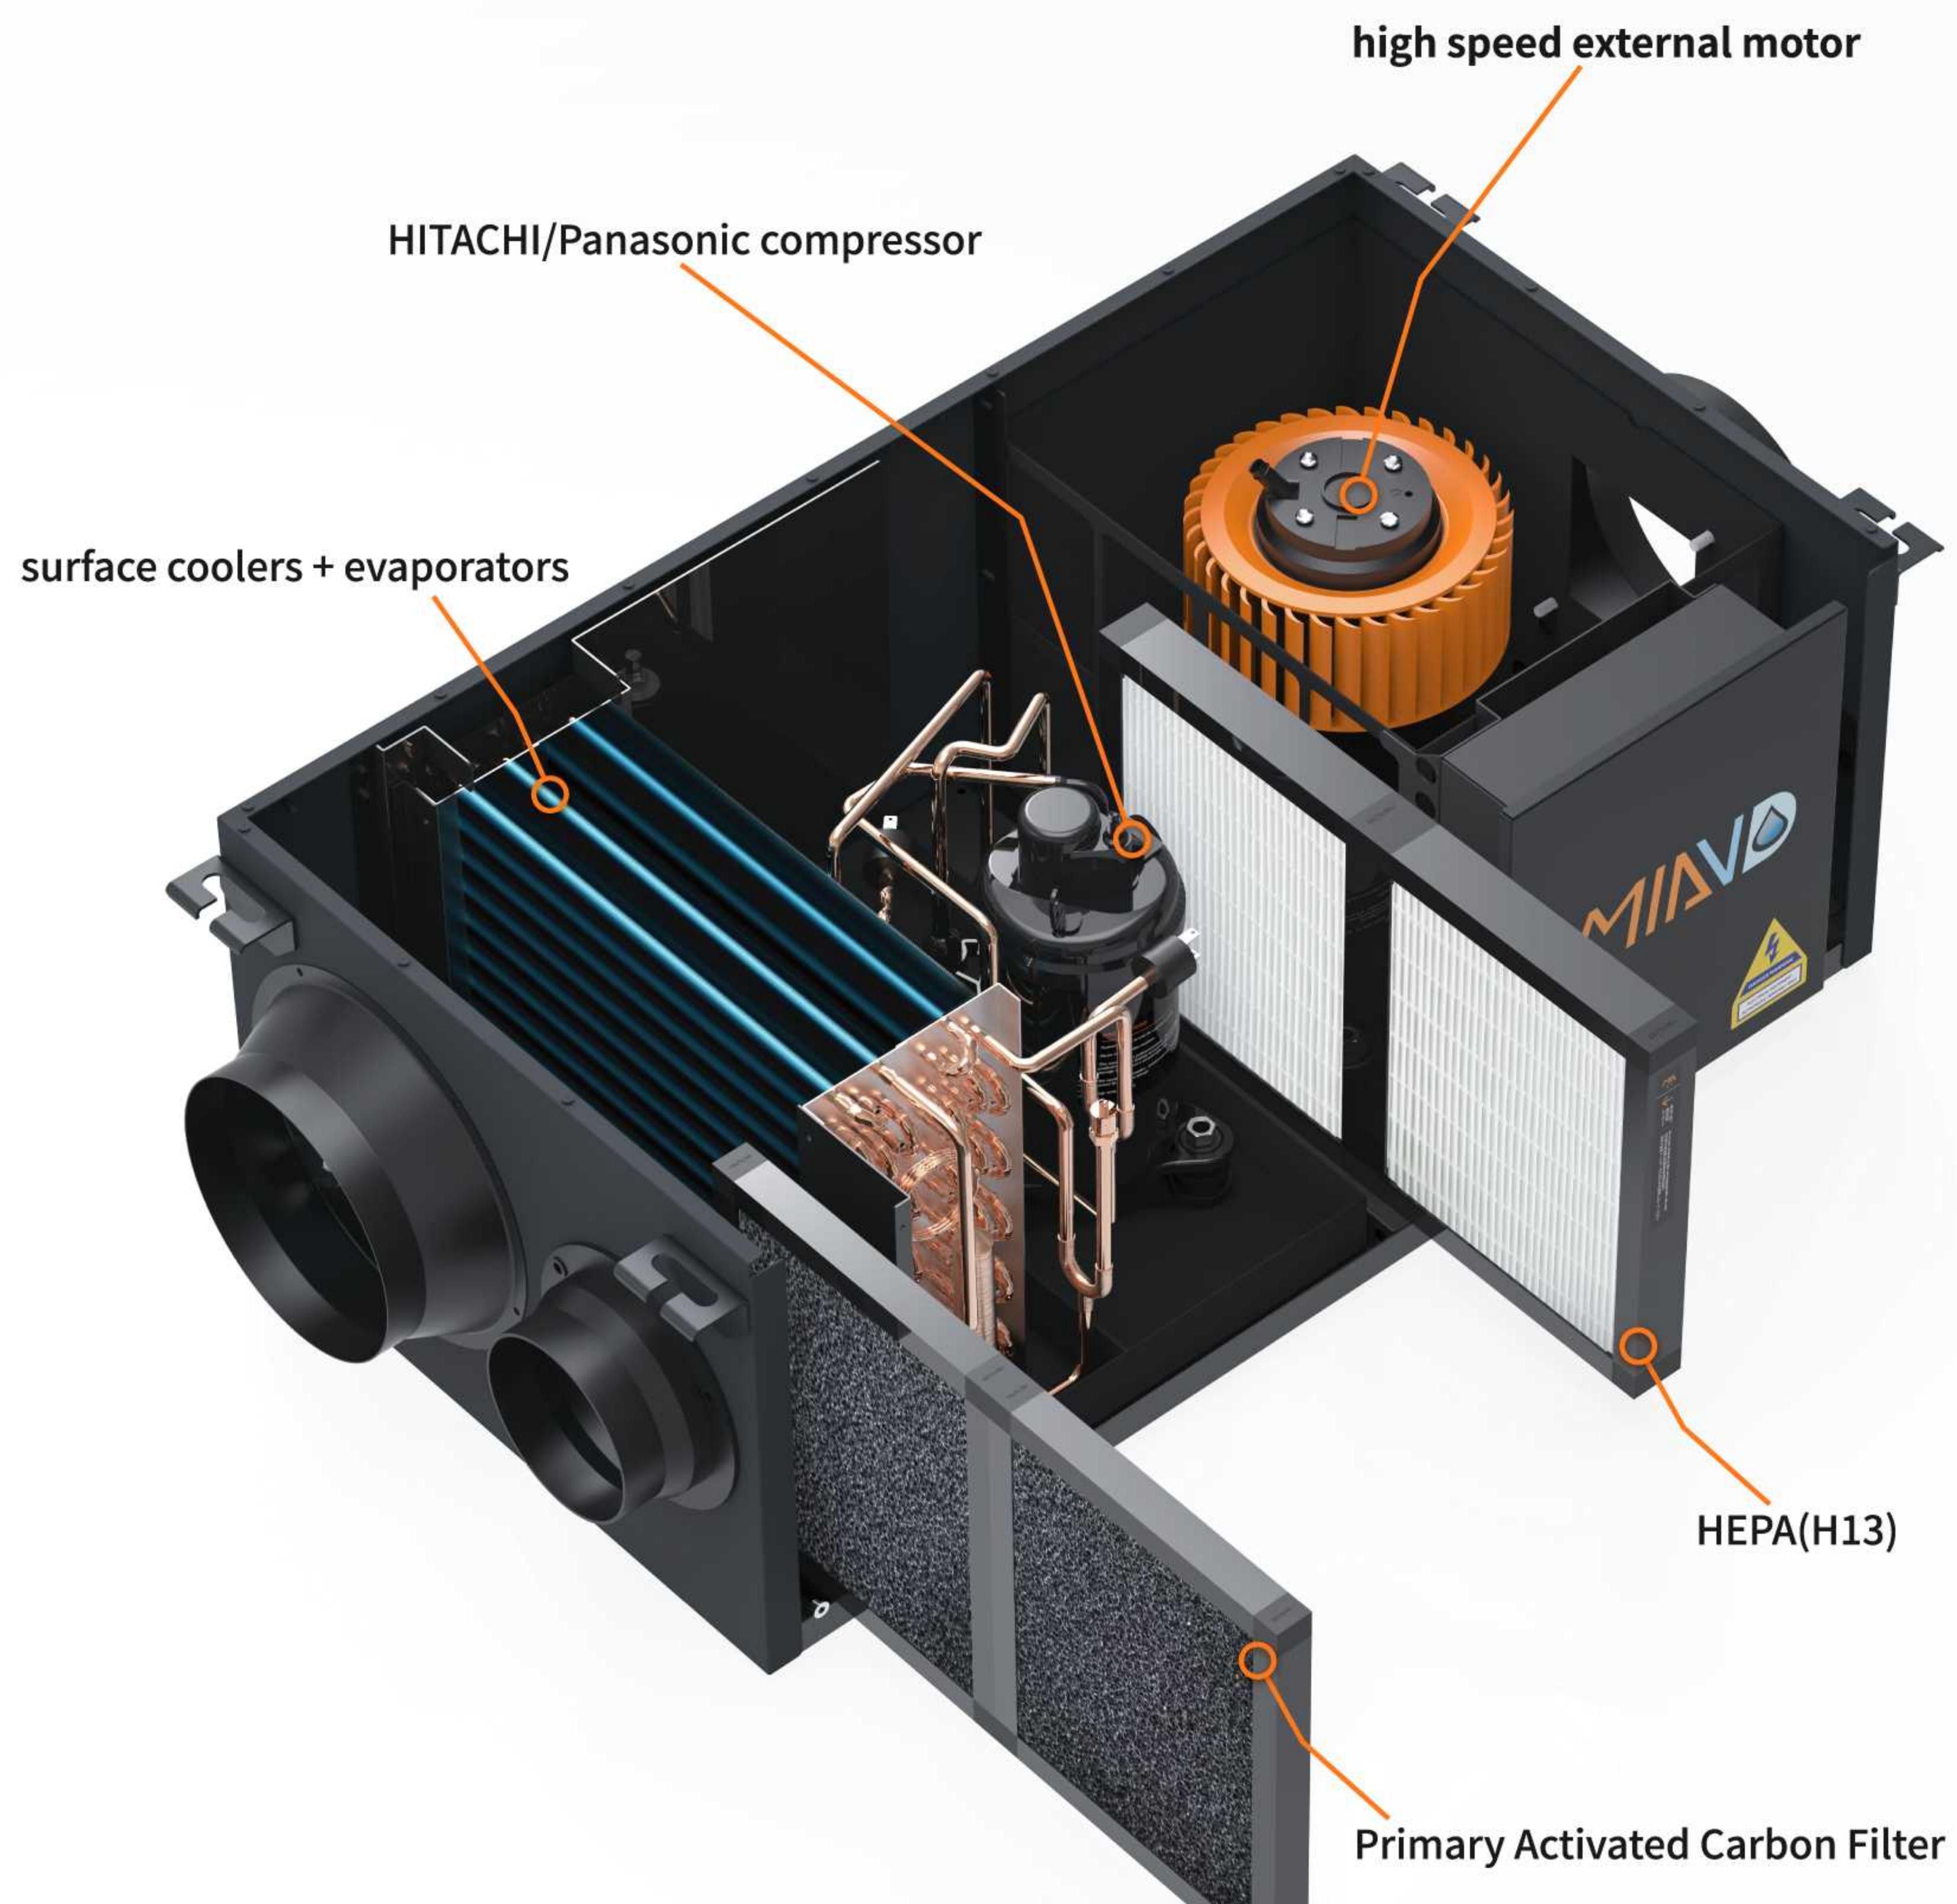

The figure above is a schematic diagram of the structure, which is subject to the actual object.

Working Principle: Extract outdoor air into the equipment, being filtered, and then sent into the room. At the same time, the inroom humid air will be sucked into the equipment, being dehumidified by the compressor surface cooler evaporator and purified by filters, and then sent back to the room. If the inroom humidity is too high and needs to be quickly removed, you can cut off the outdoor fresh air inlet and let the equipment only dehumidify the inroom air.

Exploded Views

The figure above is a schematic diagram of the structure, which is subject to the actual object.

name	model	filter
Double-flow ventilation with Multiple Filters	MIA-GL · SXL	
Double-flow ventilation with High-voltage Electrostatic Precipitator	MIA-JD · SXL	

Intelligent Control: Models below 8500m³/h use 220V power 3-speed fan, optional intelligent controller.

Pure Air: European standard H13 high efficiency ≥99.97%

ACCESSORIES

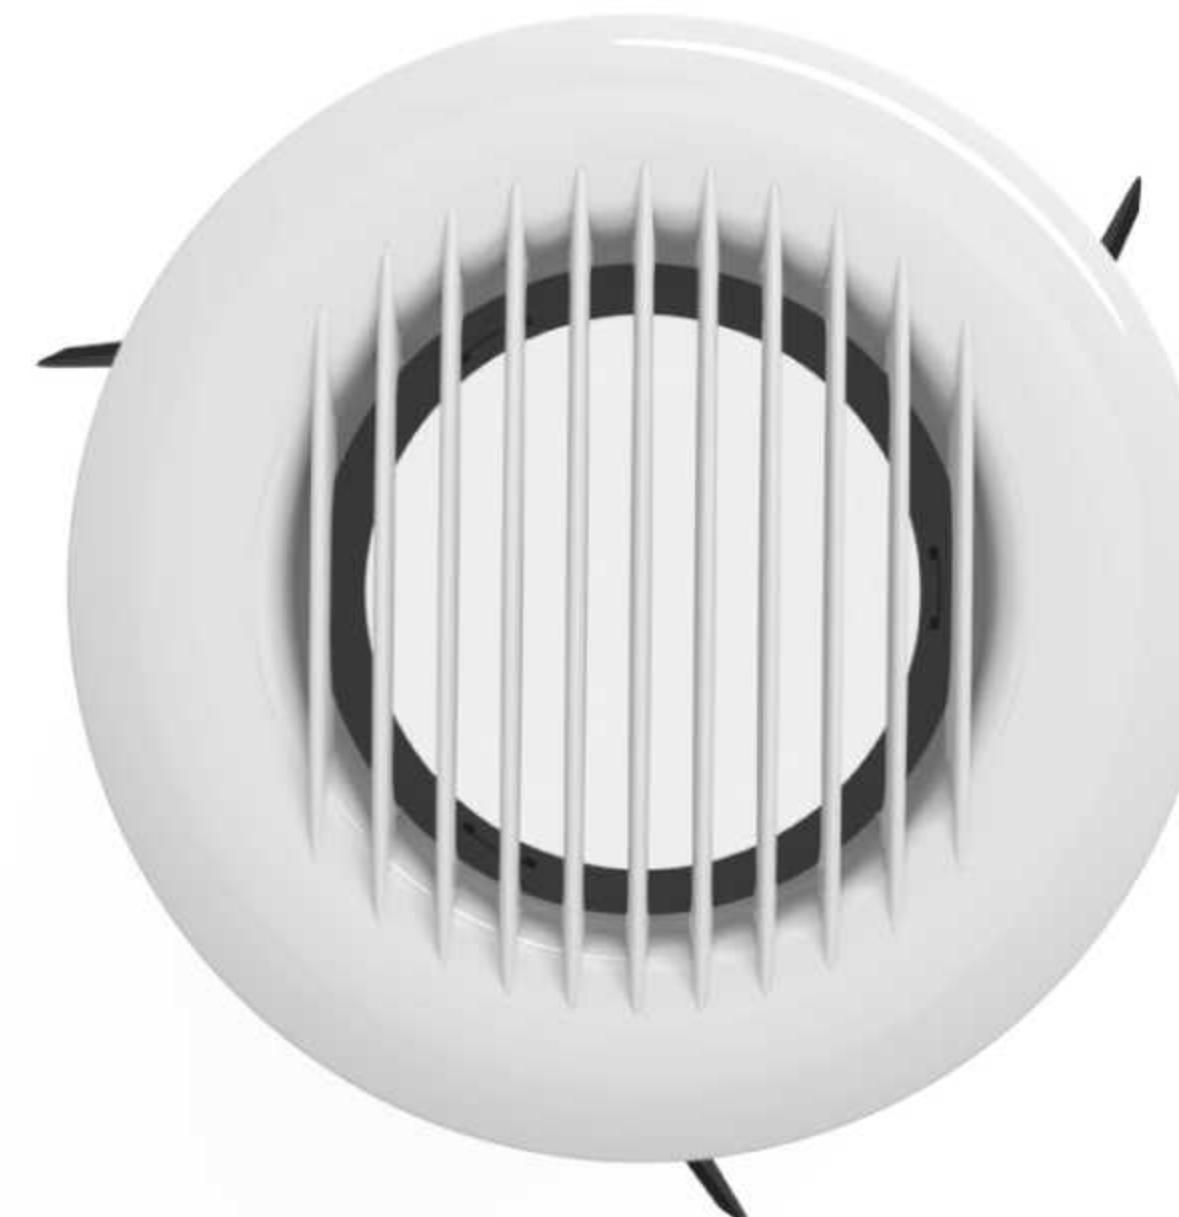

Accessories

indoor adjustable air outlet

specification(mm)

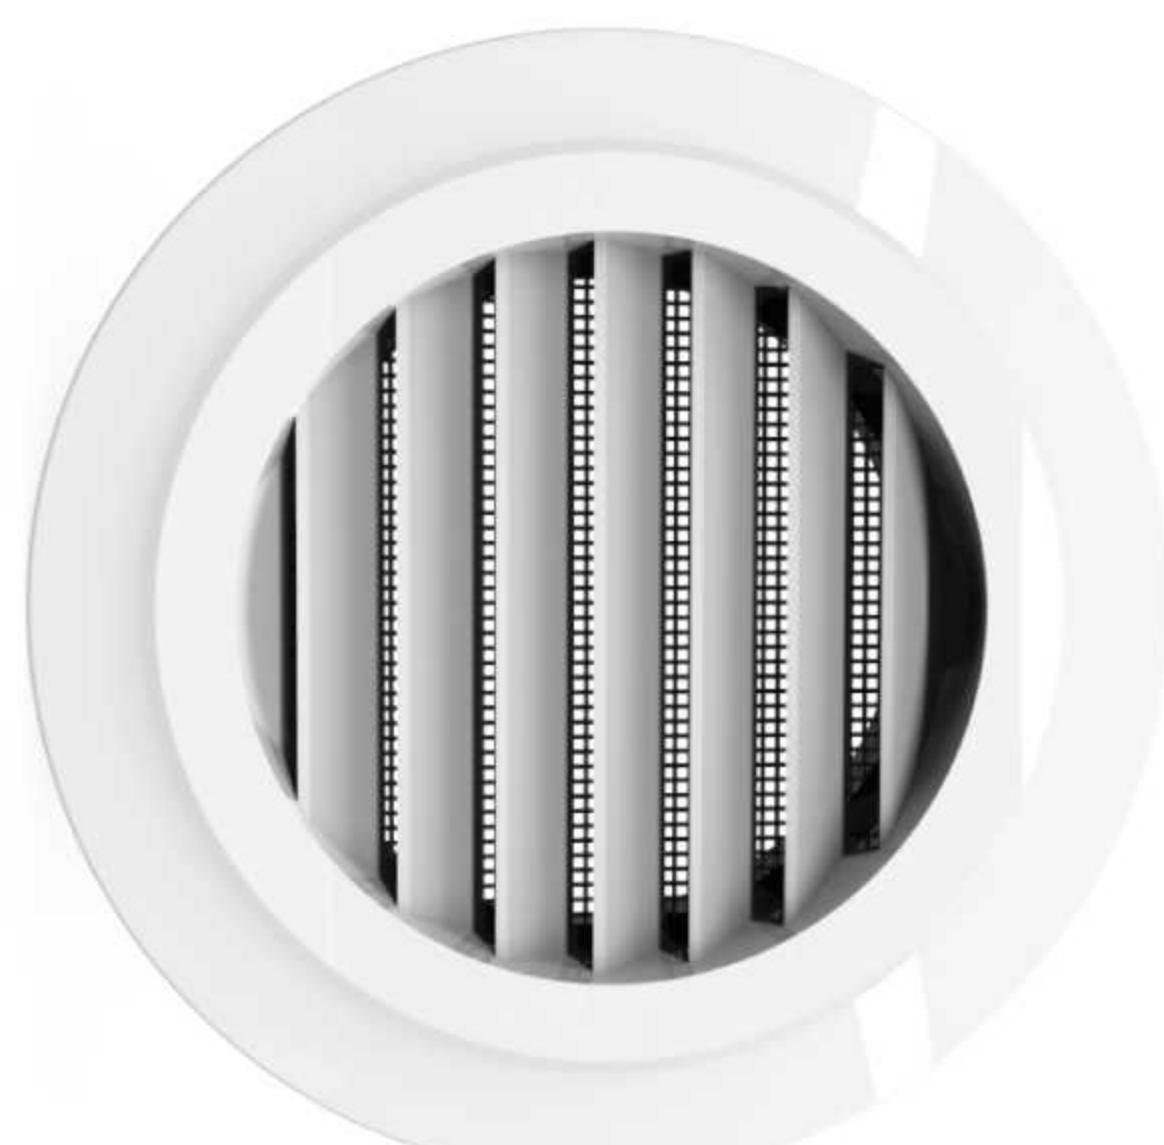

- $\phi 80$
- $\phi 100$
- $\phi 125$
- $\phi 150$
- $\phi 200$

indoor louver air outlet

specification(mm)

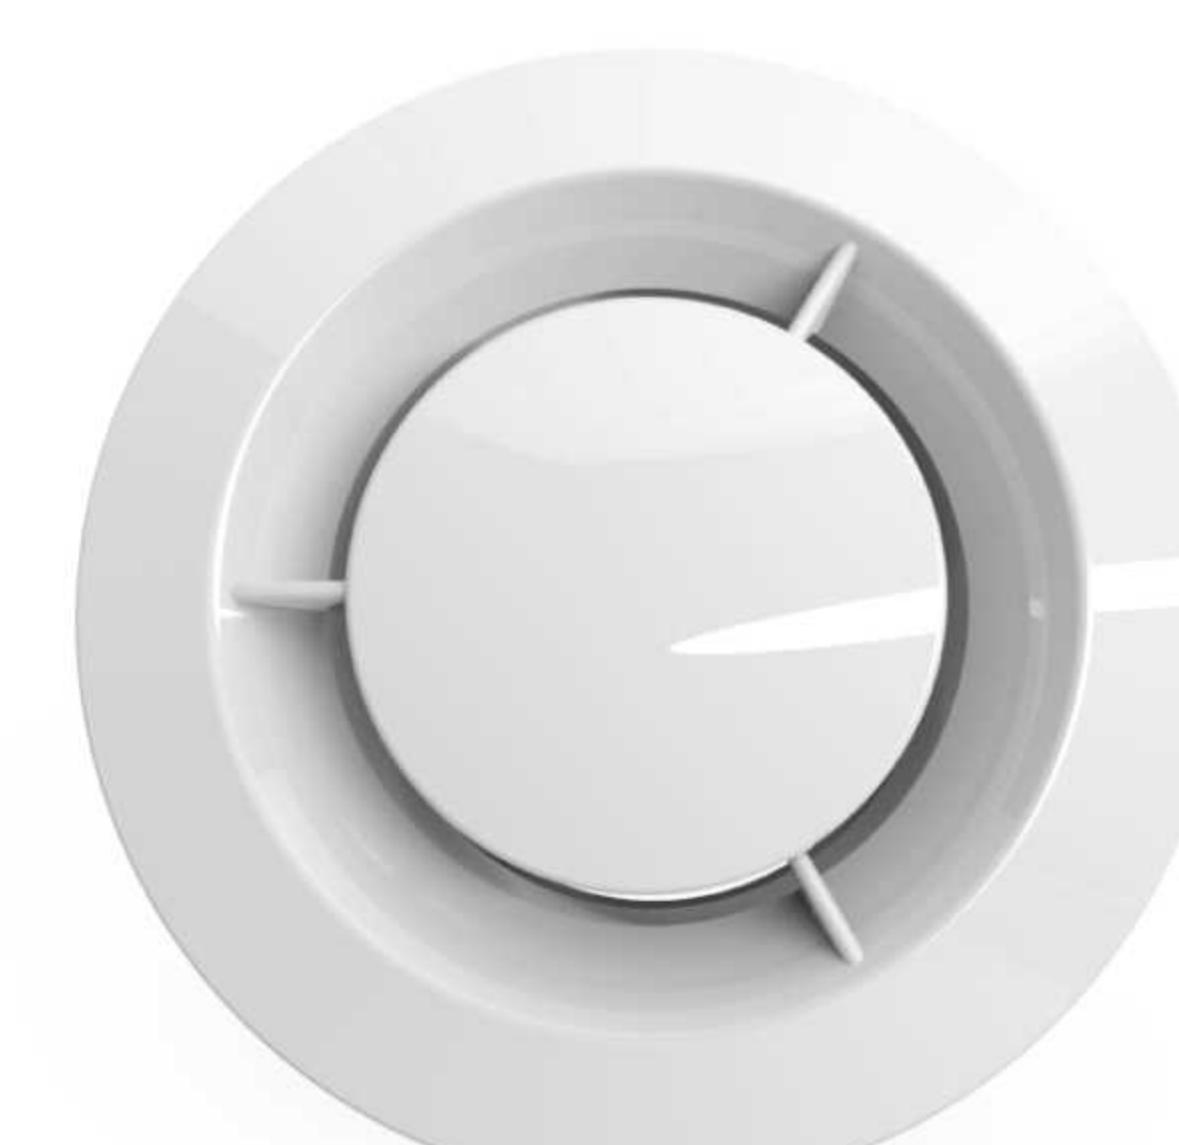

- $\phi 80$
- $\phi 100$
- $\phi 120$
- $\phi 150$

oblique louver indoor air outlet

specification(mm)

- $\phi 80$
- $\phi 100$
- $\phi 120$
- $\phi 150$

ordinary air outlet

specification(mm)

- $\phi 80$
- $\phi 120$

swirl diffusers indoor air outlet

specification(mm)

- $\phi 100$
- $\phi 150$

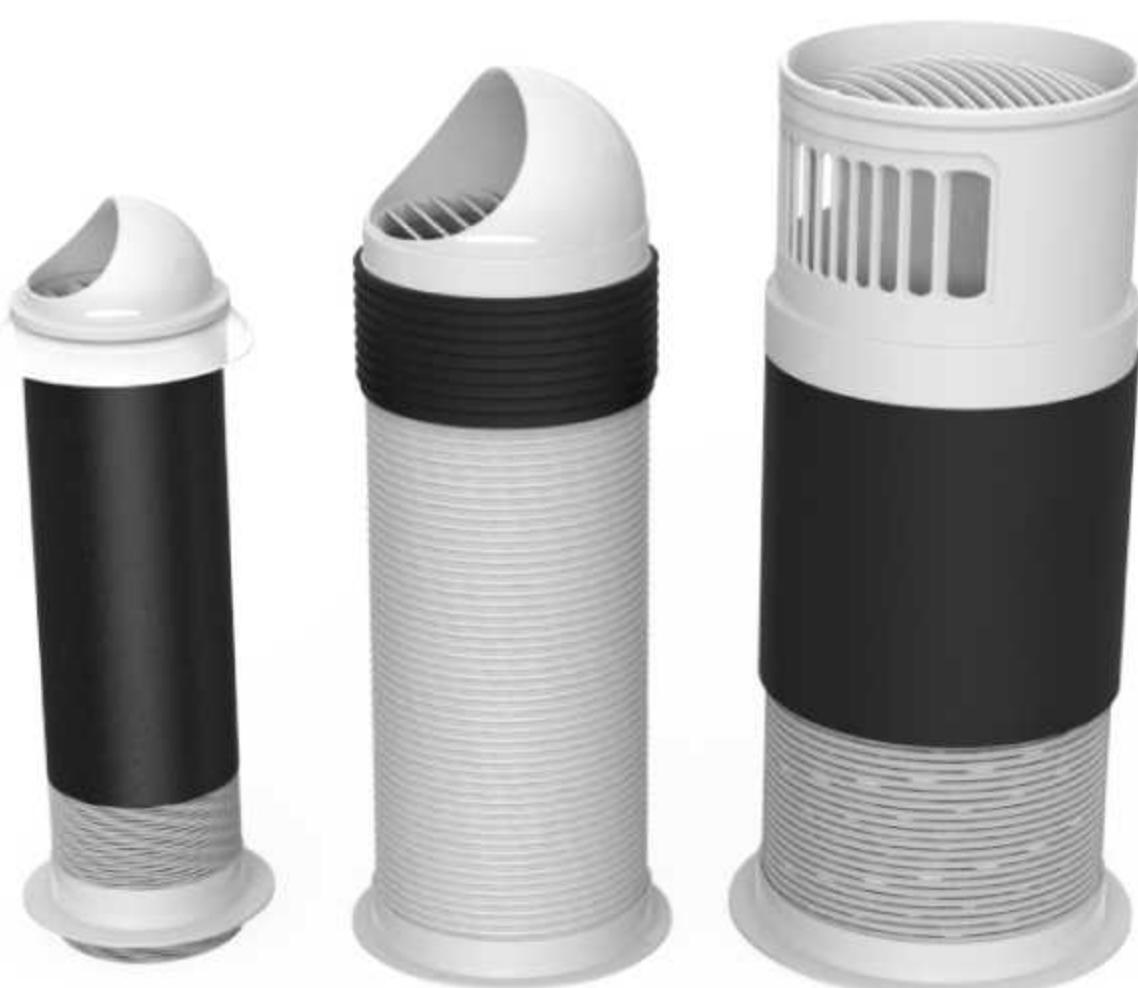

press type indoor air outlet

specification(mm)

- $\phi 100$

Accessories

wall penetrator

specification(mm)

- Φ110
- Φ160
- Φ200

Reducer

specification(mm)

- 100-75
- 160-110
- 200-160

304 stainless steel clamp

specification(mm)

- Φ72~95
- Φ105~127
- Φ141~165
- Φ194~216
- Φ251~273

stainless steel rain-proof cap

specification(mm)

- | | |
|-------|-------|
| •Φ80 | •Φ200 |
| •Φ100 | •Φ250 |
